Abstract

Re-ran TabR on the California housing dataset at the pinned commit with the paper's 15 tuned evaluation configs (exp/tabr/california/0-evaluation, seeds 0 to 14), and compared each test RMSE with the report stored in the repository for the same seed. Environment: PyTorch 2.11 with CUDA 12.8 in place of the pinned 1.13 (the GPU needs it), conda-forge faiss-gpu 1.14, TORCH_FORCE_NO_WEIGHTS_ONLY_LOAD=1 for the checkpoint format. Datasets and stored results for other experiments were moved out of the working copy; Python's hostname lookup returns localhost so it does not appear in log file names. One NVIDIA RTX 5060 Ti.

About this record

Title, authors and abstract were provided by the authors and reviewed for completeness, not for scientific soundness. Every number in this record is copied from the signed data of the sealed reports [2], which remain authoritative. This cover page is not signed. Check it against the SHA-256 listed at <https://kveritas.org/records/2610.00020v1>, and verify each report with its code bundle: `kveritas verify <report.pdf> --bundle <bundle.zip>`.

1 Sealed reports

The experiments were sealed with K-Veritas [1], which binds each result to the code, hardware and time that produced it.

Each report and code bundle must hash to these values. A bundle belongs to the report whose signed data names its hash.
